## Hitachi Elevator

## " f - VFI-II

## VFI-II

The VFI elevator has been reborn with the latest and most reliable Hitachi technology for a sustainable environment.
The new VFI-II elevator serves as an environmentally friendly transportation system to your building in addition to being reliable, safe, comfortable, of high quality and user-friendly.

## d Energy conservation

A gearless traction machine with Permanent Magnet-type synchronous motor (PM motor) conserves energy by improving power efficiency.
A PM motor is also used in the drive unit for car doors and a direct drive method is employed to realize improved energy efficiency and smoother door opening and closing motions.

Gearless traction machine with PM motor

## § Energy-saving features

$\int$ Automatic dimming of indication light The brightness of the elevator hall and car position indicator is dimmed automatically after a preset duration when elevator is idle
$\int$ Automatic turn-off of car lighting and fan In the event that the elevator is idle, the lighting and ventilation fan in the elevator are automatically turned off to conserve energy.

Hall and car buttons using LED ligh Hall and car buttons utilize LED light which consumes less energy
Hall lanterns using LED light (optional) Hall lanterns using LED light are available for your selection.

PM motor with VVVF door control
$\int$ Regenerative system (optional) Making use of the energy generated by an elevator when traveling downwards with a heavy car load or upwards with alightcar load, the tractionmachine acts as a power generator to transmit power back to the electrical network in the building
$\int$ Energy saving operation control (applicable to FI -600 group control only) As one of the standard functions of the $\mathrm{Fl}-600$ group control system. The operation reduces energy consumption of elevators by forecasting the traveling routes and occupancy rate of elevators during low traffic

## § Space-saving design

The VFI-II elevator requires a smaller machine room size through the use of slimmer traction machine, control panel and machine room equipment. This allows flexibility in building design through maximizing the usage of building space

## 』The human touch

The VFI-II elevator provides a comfortable ride and appeals to different aspects of the human sense, touch, sight and hearing - by the integration of tactile button,TFT(LCD) display voice synthesizer and multi-beam door sensor.
Floor button flashing function:
The registered car destination floor button flashes when the car approaches the destination floor
The human touch: Multi-beam door sensor
Intton with Braille and tactile,
Ine the event where the beam paths are obstructed, this sensor, installed on the edge of the doors, will keep
Hearing: Voice synthesizer (optional)
Preset standard messages are announced to the passengers by a voice synthesizer.

## D Intelligent group control system

§ VFI-II comes with Hitachi's new group control system, FI-600 Shortening waiting times and reducing the probability of a long wait ${ }^{2}$ (2) are always the most critical concerns of group control systems.
Hitachi has been striving for the development of control algorithms to address these concerns. A new algorithm, "Future reference-trajectory control" is used for the Fl-600.
The probability of a long wait ${ }^{(2)}$ is minimized by operating elevator cars at equal time intervals while forecasting future trajectories.

Evolution of Hitachi's group control systems

( With our proprietary algorithm,"Future reference-trajectory control", changes in traffic demand are taken into account.
A future reference-trajectory control algorithm that forecasts the future trajectory of elevator cars is implemented in $\mathrm{Fl}-600$. $\mathrm{Fl}-600$ is a next-generation elevator group supervisory control system using advanced forecasting trajectory technique, by means of a high performance RISC* micro-controller and intelligent processing application technology.

Using this algorithm, you can determine and configure the optimum trajectory by taking into account not only the past and present usage data, but also the trend of future traffic demand. This allows the system to cope with the change in status flexibly and quickly, optimizing the allocation and operation of elevator cars for every user. -RISC: Stands for Reduced Instruction Set Computer. It is a micropprocessor
that implements high-speed operation with a smal number of simple

## What is future reference-trajectory-control?

Generally speaking, a group of elevator cars must be operated at equal time intervals to minimize passenger waiting times, but in heavy traffic conditions, cars are frequently operated in a bunch, or all cars would end up clustering around the same level on their way and moving in the same direction in unison. In the conventional group control method, the most available cars at that moment are allocated to hall calls to eliminate local bunching, but when heavy traffic conditions are prolonged, this state cannot be completely eliminated, resulting in long waiting times In contrast, with future reference-trajectory control, elevator cars are controlled by taking into account their forecasted trajectories, allowing shorter passenger waiting times and reducing the probability of a long wait(-2).

## ( Major advantages of FI-600

The $\mathrm{Fl}-600$ controls the fluctuation in waiting times, thereby shortening the average waiting times, reducing the probability of a long wait ${ }^{(2)}$ during heavy traffic, and improving the "quality of waiting times" of users.

D Reduce average waiting time by as much as $10 \%^{(1)}$

』 Reduce probability of a long wait ${ }^{(2)}$ by up to $12 \%^{(1)}$

## $\downarrow$ FI series group control system

|  |  |  |  | Standard specification Optional specification - Not applicable |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Fl series |  |  |
| No. | Function |  | Description | 600 | 100 | 10 |
| 1 | Instantaneous reservation and service forecasting <br> (FI-IRF) |  | Upon receipt of a hall call, this function activates an elevator to serve this call, and at the same time the call is acknowledged by the hall lantern and chime. | - | - | - |
| 2 | Arrival notice indication (FI-ANI) |  | Four to five seconds prior to the arrival of an elevator, this function will activate the hall lantern flickering and the chime sound. | - | - | $\triangle$ |
| 3 | Basic call assignment control | Future referencetrajectory control (FI-FRTC) | Controls the allocation of elevator cars to hall calls according to the future reference trajectory resulting from learning-based daily traffic flows. | - | - | - |
| 4 |  | Referencetrajectory control (FI-RTC) | Controls the allocation of elevator cars to hall calls based on the theory used in the highest model in the FI series, $\mathrm{FI}-600$, and the intelligent-based data containing our know-how accumulated over a long period of time. | - | - | - |
| 5 |  | Ring control (FI-RC) | Allocates an elevator car closest to the floor where a new hall call is made. | - | - | - |
| 6 | Bunching prevention (FI-BP) |  | This function prevents local bunching of elevator cars using the "future reference-trajectory control" or the "reference trajectory control" for operating cars at equal time intervals. | - | - | - |
| 7 | Learning function | Collection of usage data (FI-CUD) | Collects the traffic status information by floor and direction for a unit time based on the elevator information such as car positions and the number of passengers getting on and off, and hall call information. | - | - | - |
| 8 |  | Recognition of traffic flow mode (FI-RTM) | Extracts characteristics at any given moment, including congested floors, from the collected usage data, and identifies the traffic flow mode at that moment. | $\underset{\substack{40 \\ \text { mode }}}{\bigcirc}$ | $\underset{\text { mode }}{\bullet}$ | - |
| 9 |  | Search for optimum operation program (FI-SOP) | Searches the optimum operation program of the moment based on the identified traffic mode. | - | - | - |
| 10 | Congested floor recognition (FI-CFR) |  | Identifies congested floors according to the usage data learned in each traffic flow mode. | - | - | - |
| 11 | Service forecasting for hall call assignment <br> (FI-SFH) |  | This function assigns elevator cars to hall calls more precisely by forecasting the arrival time and number of passengers in the car according to the learning-based traffic demand. | - | - | - |
| 12 | Intelligent function | Generation of new traffic flow modes (FI-GNT) | Extracts new characteristics according to the learning-based usage data, and registers them as a building-specific new traficic flow mode. | - | - | - |
| 13 |  | Generation of optimum operation programs (FI-GOP) | Generates an optimum operation program for a building by simulating the elevator operation according to the usage data learned in each traffic mode and preferential control target. | - | - | - |
| 14 | Energy-saving preference control (FI-ESC) |  | This system reduces the number of elevator cars in service when traffic demand is low. | $\bullet$ | - | - |
| 15 | Floor standbycontrol | Forecasting dynamic allocation control (FI-FDA) | Dynamically allocates elevator cars in response to continuously changing situations in the building by determining the area assigned to each car according to the forecasted number of passengers and car usage. | - | - | - |
| 16 |  | Zone distribution control <br> (FI-ZD) | Distributes the idle elevator cars to the pre-assigned zones. | - | - | - |
| 17 |  | Fixed floor <br> distribution control <br> (FI-FD) | Distributes the idle elevator cars to the pre-assigned floors. | - | - | $\bullet$ |
| 18 | Learning-based concentrated service <br> (FI-LCS) |  | Centralizes the service to the learning-based congested floors during peak times including morning, lunch time and evening peaks while taking the service for other floors into account. | - | - | - |
| 19 | Automatic door open time control (FI-ADT) |  | This function automatically controls the duration of the door open time according to the floor and the kind of call (hall call or car call) as well as the elevator condition. | - | - | - |

## O Operating systems and functions

Depending on your requirements and the number of elevators in a group, customers can choose from a range of collective control systems, group control systems (including FI-series group control system) and operating systems. There are also basic and optional functions which you can choose from, depending on the building type and building requirements.

Safety functions
Legend STD: Standard

| No. | Name |

| 12 | Fire rated landing door |

12 Fire rated landing door

| Description | STD | OPT |
| :---: | :---: | :---: |
| In the event that the beam paths are obstructed, this sensor, installed at the edge of the doors, will keep the doors open. | - |  |
| In the event of door overload, such as when passengers get their fingers, hands or personal belongings caught in the door, this system automatically senses this and either re-closes or re-opens the doors to prevent injury. | - |  |
| An interphone system is provided for emergency communication between the elevator and the master unit (in the supervisory panel, etc.). | - |  |
| In the event of a power failure, an emergency light inside the elevator will be automatically activated. | - |  |
| In the unlikely event of temporary trouble during operation, the elevator automatically goes to the nearest floor at a low speed and doors will open to prevent passengers from being trapped inside. | $\bigcirc$ |  |
| In the event of overloading, this system will activate an audio/ visual signal to prevent the elevator from moving. | - |  |
| Mechanical safety units are installed on both sides or one side of the elevator doors. In the event of passengers coming into contact with the safety edges of closing doors, the doors will immediately reopen. |  | $\bigcirc$ |
| This device detects passengers getting on or off the elevator, keeping the doors open as long as passengers are within the area of detection |  | - |
| In the event that the elevator is moving downwards at an abnormally high speed, the breakers will be automatically engaged and the elevator will cease operation. | - |  |
| In the event that the elevator stops out of the door open zone of a selected floor, doors will not open, and an alarm will be sounded in the elevator. | - |  |
| When an abnormal increase in power supply to the elevator system is detected, the power supply will be cut off to prevent damages to the elevator equipment. |  | - |
| 2 hours fire rated landing door are available where required |  | $\bullet$ |

|  | Management func | ns Le | Legend | STD: Standard |
| :---: | :---: | :---: | :---: | :---: |
| No. | Name | Description | STD | OP |
| 1 | Automatic turn-off of elevator light and fan(ATFL) | In the event that the elevator is not in use, the light and ventilation fan in the elevator are automatically turned off to conserve energy. | - |  |
| 2 | Maintenance operation(MTNO) | In the event that elevator maintenance is being carried out, the elevator operates at a lower speed. | - |  |
| 3 | Parking operation(PKGO) | The elevator can be parked at the designated floor with a key switch. |  | - |
| 4 | Rush-hour schedule operation(RHSO) | All the elevators will automatically return to the start floor, after serving the last call during this preset rush-hour timing. |  | - |
| 5 | Floor lock-out operation(FLLO) | Specific service floors can be locked-out by activating a switch. |  | - |
| 6 | Floor lock-out operation by cipher code (ROCC) | By inputting a pre-programmed code using the car operating board floor buttons, passengers can gain access to certain restricted floors. |  | - |
| 7 | Intelligent operation security system (IPSS) | This function allows controlled access to certain floors by means of a password or ID cards. <br> Note: Keypad or ID card-reader system is to be provided and installed by others. Interfacing shall be by means of dry (voltage-free) contacts. |  | - |
| 8 | Interfacing with closed-circuit TV (CCTV) | This system enables the security personnel to monitor the movement inside the elevator. This will be effective in preventing criminal and mischievous acts inside the elevator. (CCTV system, including wiring, is to be supplied by others.) |  | - |
| 9 | Supervisory panel(SVP) | This panel provides various supervisory operations, including communication and status monitoring. |  | - |
| 10 | Elevator monitoring system (EMS) | This system shows the real time situation of the elevators such as the elevator position, movement direction and abnormal operation on the PC (Personal Computer) display. It is also possible to turn on/off the elevators and change the service floors of the elevators using the PC. |  | $\bullet$ |
| 11 | Interfacing to building management system (BMS) | This interfacing shall be done by means of electrical dry contact to the building management system for their monitoring. |  | $\bigcirc$ |
| 12 | Regenerative system (RGNS) | When traveling downwards with a heavy car load or upwards with a light car load, the traction machine acts as a power generator to transmit power back to the electrical network in the building. |  | $\bullet$ |

## 乞Electrical Information

shows the works to be done by others.
Pit lightings, including wiring and piping, are to be provided by others ninimum 200 lux at floor level). Power socket outlet, including wiring and piping in pit, are to be provided by others.

| and piping in pit, are | provided by others. | -0-00 |  |
| :---: | :---: | :---: | :---: |
| Item | Work to be provided by others |  |  |
|  | To install facilities to ensure that power does not fluctuate outside the range of $-10 \%$ to $+5 \%$ of the normal voltage rating and to ensure that the unbalance factor of voltage does not exceed $5 \%$. |  |  |
| Main power supply ${ }^{(1)}$ |  |  |  |
| Lighting power supply ${ }^{(1)}$ | To provide lighting power supply for car lighting indicators and maintenance work. | Master interohone ${ }^{\text {a }}$ |  |
| Interphone | To provide pipes and wiring located outside hoistway. To provide 12 interphone wires of $0.9 \mathrm{~mm}^{2} /$ elevator. |  |  |
| Ventilation | To provide mechanical ventilation to the machine room to ensure that the temperature in the machine room is maintained at below $38^{\circ} \mathrm{C}$. | Pit light and switch |  |
| Pit light, power outlet | To provide single-phase AC 200V, 10A power outlet and pit lighting with switch below the entrance floor level for maintenance purposes. |  |  |

## Electrical data

## §Other Information

When building contractor provides the temporary void on the machine room floor for hoisting up elevator equipment, building contracto shall provide an additional suspension hook, positioned directly above the center of the void. (For details, please consult with Hitachi.)

## § Electrical Information

Wiring diagram
shows the works to be done by others
Pit lightings, including wiring and piping, are to be provided by others minimum 200 lux at floor level). Power socket outlet, including wiring and piping in pit, are to be provided by others.

| Item | Work to be provided by others |
| :---: | :---: |
| Main power supply ${ }^{\text {(1) }}$ | To install facilities to ensure that power does not fluctuate outside the range of $-10 \%$ to $+5 \%$ of the normal voltage rating and to ensure that the unbalance factor of voltage does not exceed $5 \%$. |
| Lighting power supply ${ }^{(11)}$ | To provide lighting power supply for car lighting indicators and maintenance work. |
| Interphone | To provide pipes and wiring located outside hoistway. To provide 12 interphone wires of $0.9 \mathrm{~mm}^{2}$ / elevator. |
| Ventilation | To provide mechanical ventilation to the machine room to ensure that the temperature in the machine room is maintained at below $38^{\circ} \mathrm{C}$. |
| Pit light, power outlet | To provide single-phase AC 200V, 10A power outlet and pit lighting with switch below the entrance floor level for maintenance purposes. |

## Electrical data

Required capacity of circuit breaker, transformer and starting power at building side

: For India use only.

[^0]:    DX-23S Ceiling design
    Center
    Both side
    Half mirror
    : Painted aluminum
    Ceiling trim with recess
    Lighting $\quad:$ : Anodizescent aluminum
    Height (from floor) : 2300mm
